**Abstract**—This document contains the solution to problem 26 from 3.9 Matrix Exercises

## 1 PROBLEM

If

$$\mathbf{A} = \begin{pmatrix} 1 & 0 & 2 \\ 0 & 2 & 1 \\ 2 & 0 & 3 \end{pmatrix}, \quad (1.0.1)$$

Prove that

$$\mathbf{A}^3 - 6\mathbf{A}^2 + 7\mathbf{A} + 2\mathbf{I} = \mathbf{0} \quad (1.0.2)$$

## 2 SOLUTION

The characteristic equation is

$$|\mathbf{A} - \lambda\mathbf{I}| = 0 \implies \begin{vmatrix} 1-\lambda & 0 & 2 \\ 0 & 2-\lambda & 1 \\ 2 & 0 & 3-\lambda \end{vmatrix} = 0 \quad (2.0.1)$$

$$\implies (1-\lambda)(2-\lambda)(3-\lambda) + 2(-2(2-\lambda)) = 0 \quad (2.0.2)$$

$$\implies \lambda^3 - 6\lambda^2 + 7\lambda + 2 = 0 \quad (2.0.3)$$

The above equation is similar to the equation to be proved.

By the Cayley-Hamilton theorem, every square matrix satisfies its own characteristic equation.

Hence proved that  $\mathbf{A}^3 - 6\mathbf{A}^2 + 7\mathbf{A} + 2\mathbf{I} = \mathbf{0}$ .
